Final Exam, Version 3
CSci 127: Introduction to Computer Science
Hunter College, City University of New York

16 December 2019

Answer Key:

1. (a) What will the following Python code print:

i.
```
pioneers = "Jones-Karen Spark;Jobs-Steve;Gates-Bill"
print(pioneers[-4:],pioneers[-10:-5])
print(pioneers.count('-'))
```

Answer Key:
```
Bill Gates
3
```

ii.
```
names = pioneers.split(';')
m = names[1]
print(m[:4])
```

Answer Key:
```
Jobs
```

iii.
```
for n in names:
    print(n.split('-')[0].upper())
```

Answer Key:
```
Jobs
JONES
JOBS
GATES
```

(b) Consider the following shell commands:

```
$ ls
snow.png  p30.py  p40.py  tickets.png
```

i. What is the output for:
```
$ ls *png
```

Answer Key:
```
snow.png   tickets.png
```

ii. What is the output for:
```
$ ls | grep py | wc -l
```

Answer Key:
```
2
```

iii. What is the output for:
```
$ mkdir new
$ touch stars.png
$ cd new
$ ls
```

Answer Key:
```
stars.png
```

2. (a) Consider the code:

Answer Key:

```
import turtle
thomasH = turtle.Turtle()
```

i. After the command: `thomasH.color("#00DD00")`, what color is `thomasH`?
☐ black **X** green ☐ white ☐ gray ☐ purple

ii. After the command: `thomasH.color("#FFFFFF")`, what color is `thomasH`?
☐ black ☐ green **X** white ☐ gray ☐ purple

iii. Fill in the code below to change `thomasH` to be the brightest red:
`thomasH.color("#` **F** **F** **0** **0** **0** **0** `")`

iv. Fill in the code below to change `thomasH` to be the color black:
`thomasH.color("#` **0** **0** **0** **0** **0** **0** `")`

(b) Fill in the code to produce the output on the right:

i. **Answer Key:**
```
for i in range( 9 ):
    print(i, end=" ")
```

Output:

```
0 1 2 3 4 5 6 7 8
```

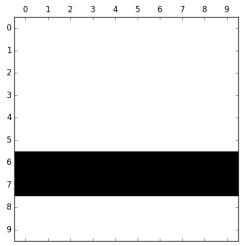
ii. **Answer Key:**
```
for j in range( -1, 4, 1 ):
    print(i, end=" ")
```

Output:

```
-1 0 1 2 3
```

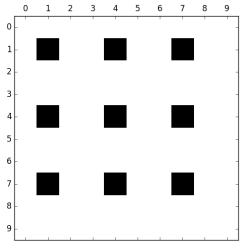
iii. **Answer Key:**
```
import numpy as np
import matplotlib.pyplot as plt
im = np.ones( (10,10,3) )
im[6:7,:,:]  = 0
plt.matshow(im)
plt.show()
```

Output:



iv. **Answer Key:**
```
import numpy as np
import matplotlib.pyplot as plt
im = np.ones( (10,10,3) )
im[1::3 , 1::3 , :]  = 0
plt.matshow(im)
plt.show()
```

Output:



3. (a) What is the value (True/False):

i.
```
in1 = False
in2 = True
out = in1 or in2
```

Answer Key:
```
out = True
```

ii.
```
in1 = True
in2 = True
out = not in1 or (in2 and not in2)
```

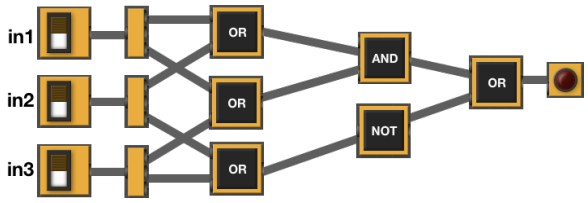
Answer Key:
```
out = True
```

iii.
```
in1 = True
in2 = True or not in1
in3 = in1 or in2
out = in1 and not in3
```

Answer Key:

```
out = False
```

iv.



```
in1 = True
in2 = False
in3 = False
```

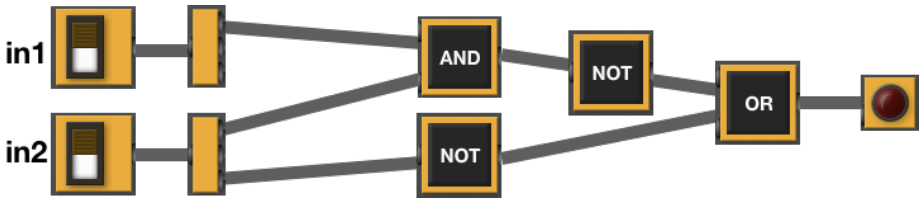
Answer Key:

```
out = True
```

(b) Draw a circuit that implements the logical expression:

```
(not (in1 and in2) and (not in2))
```

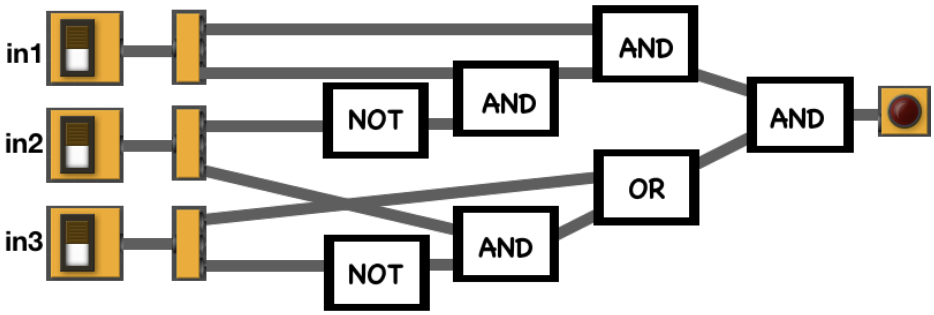
Answer Key:



(c) Fill in the circuit that implements the logical expression:

```
(in1 and (in1 and (not in2))) and (in3 or (in2 and (not in3))
```

Answer Key:



4. (a) Draw the output for the function calls:

i. `ramble(tyler,4,True)`

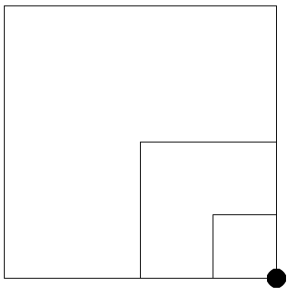
Answer Key:

```
import turtle
tyler = turtle.Turtle()
tyler.shape('circle')

def ramble(tori, dist, repeat):
     if dist > 5:
          for i in range(4):
               tori.left(90)
               tori.forward(dist*10)
          ramble(tori,dist//2,repeat)
     elif repeat:
          for i in range(dist):
               tori.forward(20)
               tori.stamp()
     else:
           tori.stamp()
```

ii. `ramble(tyler,30,False)`

Answer Key:



(b) What are the formal parameters for `ramble()`:

Answer Key: tori, dist, repeat

(c) If you call `ramble(tyler,4,True)`, which branches of the function are tested: **Answer Key:**

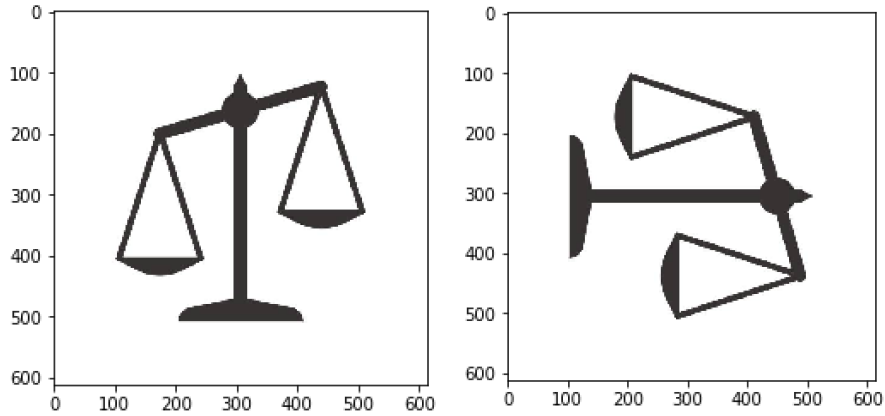
- ☐ the `if`-clause only,
- **X** the `elif`-clause only,
- ☐ the `else`-clause only,
- ☐ `if`-clause and the `else`-clause, or

☐ all the clauses are visited from this invocation (call).

(d) If you call `ramble(tyler,30,False)`, which branches of the function are tested: **Answer Key:**

☐ the `if`-clause only,
☐ the `elif`-clause only,
☐ the `else`-clause only,
X `if`-clause and the `else`-clause, or
☐ all the clauses are visited from this invocation (call).

5. Design an algorithm that rotates an image by 90 degrees to the right. For simplicity, you may assume a square image (i.e. same hight and length)



Libraries:

Answer Key: matplotlib.pyplot and numpy
Input:

Answer Key: The name of the image file
Output:

Answer Key: The rotated image
Process (as a list of steps):

Answer Key:

(a) Ask user for image file name

(b) Read the image in a numpy array, call it img

(c) Create a new numpy array with same dimensions, call it img2

(d) Copy the first row of img into the last column of img2, such that img[0,0,:] == img2[0,n,:], img[0,1,:] == img2[1,n,:], ... , img[0,n,:] == img2[n,n,:]

(e) Repeat analogous process to copy the second row of img into the second-to-last column of img2, third row of img into third-to-last column of img2, and so on for all rows in img

(f) Save img2

6. Given the FiveThirtyEight dataset containing data on nearly 3 million tweets sent from Twitter handles connected to the Internet Research Agency, a Russian "troll factory", a snapshot given in the image below:

author	content	region	language	publish_date	harvested_date	following	followers	updates
10_GOP	"We have a sitting Democrat US Senator on trial	Unknown	English	10/1/2017 19:58	10/1/2017 19:59	1052	9636	253

Fill in the Python program below:

Answer Key:

```
#P6,V3: extracts dates with highest number of troll tweets

#Import the libraries for data frames and plotting data:
import pandas as pd
import matplotlib.pyplot as plt

#Prompt user for input file name:
csvFile = input('Enter CSV file name: ')

#Read input data into data frame:
trolls = pd.read_csv(csvFile)

#split date into date and time columns
trolls[['pub_date','pub_time']] = trolls.publish_date.str.split(expand=True)

#Count the number of tweets for each date:
trollDates = trolls["pub_date"].value_counts()

#Print the top 5 dates with most troll tweets
```

```
print(trollDates[:5])

#Generate a bar plot of the top 5 dates with largest number of troll tweets
trollDates.plot.bar()
plt.show()
```

7. Write a **complete Python program** that prompts the user for the name of an .png (image) file and prints the fraction of pixels that are very light. A pixel is very light if the red, green, and blue values are **all** over 90%.

   Answer Key:

```
#Import the packages for images and arrays:
import matplotlib.pyplot as plt
import numpy as np
#Ask user for image name and read into img:
inImg = input('Enter input image: ')
img = plt.imread(inImg)
#Get height and width:
height = img.shape[0]
width = img.shape[1]
#Initialize counter:
count = 0
#Loop through all the pixels:
for row in range(height):
    for col in range(width):
        #Check if each pixel is very light and update count:
        if (img[row,col,0] > .9) and (img[row,col,1] > .9) and (img[row,col,2] > .9):
             count = count + 1
#Compute and print fraction:
frac = count/(height*width)
print('Fraction light is', frac)
```

8. (a) What is printed by the MIPS program below:

   Answer Key:

   !!!!!

   (b) Modify the program to print out 99 copies of the character '!'. Shade in the box for each line that needs to be changed and rewrite the instruction below.

   Answer Key:

```
#Loop through characters
ADDI $sp, $sp, -100      # Set up stack
```

```
ADDI $s3, $zero, 1       # Store 1 in a registrar
ADDI $t0, $zero, 33      # Set $t0 at 33 (!)
ADDI $s2, $zero, 99      # Use to test when you reach 100
SETUP: SB $t0, 0($sp)    # Next letter in $t0
ADDI $sp, $sp, 1         # Increment the stack
SUB $s2, $s2, $s3        # Decrease the counter by 1
BEQ $s2, $zero, DONE     # Jump to done if $s0 == 0
J SETUP                  # If not, jump back to SETUP for loop
DONE: ADDI $t0, $zero, 0 # Null (0) to terminate string
SB $t0, 0($sp)           # Add null to stack
ADDI $sp, $sp, -100      # Set up stack to print
ADDI $v0, $zero, 4       # 4 is for print string
ADDI $a0, $sp, 0         # Set $a0 to stack pointer for printing
syscall                  # Print to the log
```

9. What is the output of the following C++ programs?

(a)
```
//Quote by Bill Gates
#include <iostream>
using namespace std;
int main()
{
    cout<<"Weve got to put\na ";
    cout<<"lot of money into \nchanging";
    cout<<" behavior."<<endl<<"B.G.";
    return 0;
}
```

Answer Key:

```
Weve got to put
a lot of money into
changing behavior.
B.G.
```

(b)
```
#include <iostream>
using namespace std;
int main()
{
    double num = 0;
    double weight = 0;
    while (weight < 100) {
        cout <<"Please enter weight\n";
        cin >> weight;
        num += weight;
    }
    cout << num << endl;
    return 0;
}
```

Answer Key:

```
Please enter weight
Please enter weight
Please enter weight
275
```

(c)

```
#include <iostream>
using namespace std;
int main(){
    int i, j;
    for (i = 1; i <= 5; i++){
        for (j = 0; j < i; j++){
            if(j % 2 == 0)
                cout << "O";
            else
                cout << "X";
        }
        cout << endl;
    }
    return 0;
}
```

Answer Key:

```
O
OX
OXO
OXOX
OXOXO
```

10. (a) Translate the following program into a **complete C++ program**:

```
#Python Loops, V3
for i in range(0,15,3):
    print(i, '*', i)
```

Answer Key:

```
//C++ Loop, V3
#include <iostream>
using namespace std;
int main()
{
    for(int i=0; i<15; i+=3)
        cout << i << " * " << i << endl;
    return 0;
}
```

(b) The number of Facebook monthly active users grew from ∼500 million in 2010 to ∼2500 million (2.5 billion) in 2019. The average annual growth rate can then be estimated as

$$\text{avgGrowth} = \frac{\%\text{growth}}{\text{number-of-years}} = \frac{100 \cdot \frac{2500-500}{500}}{2019-2010} = 44.4\%$$

We can thus estimate an average annual growth: **avgGrowth = 44.4%**

Write a **complete C++ program** that asks the user for a year greater than 2010 (assume user complies) and prints the estimated number (in millions) of monthly active Facebook users in that year.

Answer Key:

```
//Facebook monthly active users V3
#include <iostream>
using namespace std;
int main()
{
    double past = 500;
    double avgGrowth = past * .444;
    int year = 0;

    cout << "Please enter a year between 2010 and 2019 : ";
    cin >> year;

    double users = past + (avgGrowth * (year-2010));

    cout << "The number of monthly active Facebook users in ";
    cout << year << " is approximately " << users << " millions" << endl;

    return 0;
}
```
